Marks Scored			

You may use any result covered in class without proof. Do not use any result from the homework unless suggested as a hint.

1. Suppose sets A and B are equicardinal.

(a) **(1 Mark)**

Prove or give a counterexample: every injective function from A to B must also be surjective.

(b) **(1 Mark)**

Prove or give a counterexample: every surjective function from A to B must also be injective.

Solutions:

(a) Let $A = \mathbb{N} = B$. Consider the function $g : A \rightarrow B$ defined as

$$g(n) = 2n, \quad n \in \mathbb{N}.$$

Clearly, g is injective. Indeed,

$$g(m) = g(n) \implies 2m = 2n \implies m = n.$$

However, g is clearly not surjective, for the odd natural numbers do not have a pre-image under g .

(b) Let $A = \mathbb{R}$ and $B = \mathbb{R}_+ = [0, +\infty)$. Clearly, $|A| = |B|$. Consider the function $g : A \rightarrow B$ defined as

$$g(x) = x^2, \quad x \in \mathbb{R}.$$

Clearly, g is surjective, as for any $y \in \mathbb{R}_+$,

$$g^{-1}(y) = \{x \in \mathbb{R} : x^2 = y\} = \{-\sqrt{y}, +\sqrt{y}\}$$

is non-empty. However, g is not injective, as $g(-\sqrt{y}) = y = g(+\sqrt{y})$ for any $y \in \mathbb{R}_+$.

2. For each $k \in \mathbb{N}$, let $\mathcal{C}_k \subset \{0, 1\}^{\mathbb{N}}$ denote the set of all infinite binary strings containing **exactly** k ones in them. Furthermore, let $\mathcal{C} \subset \{0, 1\}^{\mathbb{N}}$ denote the set of all infinite binary strings containing **finitely** many ones in them.

(a) **(2 Marks)**

Show that \mathcal{C}_k is countably infinite for every $k \in \mathbb{N}$.

You may use the fact that $\mathbb{N}^k := \underbrace{\mathbb{N} \times \cdots \times \mathbb{N}}_{k \text{ times}}$ is countably infinite for every $k \in \mathbb{N}$.

(b) **(1 Mark)**

Express \mathcal{C} in terms of $\mathcal{C}_1, \mathcal{C}_2, \dots$, and argue that \mathcal{C} is countably infinite.

Solutions:

- (a) Fix an arbitrary $k \in \mathbb{N}$. On the one hand, consider the mapping $f_k : \mathcal{C}_k \rightarrow \mathbb{N}^k$ given by

$$f_k(\mathbf{b}) = (n \in \mathbb{N} : b_n = 1), \quad \mathbf{b} \in \mathcal{C}_k.$$

We claim that f_k is injective. Indeed,

$$f_k(\mathbf{b}) = f_k(\mathbf{b}') \implies (n \in \mathbb{N} : b_n = 1) = (n \in \mathbb{N} : b'_n = 1) \implies \mathbf{b} = \mathbf{b'}.$$

This proves that $|\mathcal{C}_k| \leq |\mathbb{N}^k| = \aleph_0$.

On the other hand, consider the mapping $g_k : \mathbb{N}^k \rightarrow \mathcal{C}_k$ given by

$$g_k : (n_1, \dots, n_k) \mapsto \underbrace{1 \cdots 1}_{n_1} 0 \underbrace{1 \cdots 1}_{n_2} 0 \cdots \underbrace{1 \cdots 1}_{n_k} 0, \quad (n_1, \dots, n_k) \in \mathbb{N}^k.$$

Then, we claim that g_k is injective. Indeed,

$$\begin{aligned} g(n_1, \dots, n_k) = g(n'_1, \dots, n'_k) &\implies \underbrace{1 \cdots 1}_{n_1} 0 \underbrace{1 \cdots 1}_{n_2} 0 \cdots \underbrace{1 \cdots 1}_{n_k} 0 = \underbrace{1 \cdots 1}_{n'_1} 0 \underbrace{1 \cdots 1}_{n'_2} 0 \cdots \underbrace{1 \cdots 1}_{n'_k} 0 \\ &\implies (n_1, \dots, n_k) = (n'_1, \dots, n'_k). \end{aligned}$$

This proves that $|\mathbb{N}^k| = \aleph_0 \leq |\mathcal{C}_k|$.

Combining the above arguments, we see that $|\mathcal{C}_k| = \aleph_0$, thus proving that \mathcal{C}_k is countably infinite.

3. We note that

$$\mathcal{C} = \bigcup_{k \in \mathbb{N}} \mathcal{C}_k.$$

Using the result in part (a) and the fact that countable union of countable sets is countable, we deduce that \mathcal{C} is countable. Because $\mathcal{C} \supseteq \mathcal{C}_1$, and \mathcal{C}_1 is countably infinite, we deduce that \mathcal{C} is countably infinite.
