JUL'15 – MAR'22

- Analysed the problem of finding an anomalous process (arm) in a multi-armed bandit as quickly as possible, subject to an upper bound on the error probability (target applications: neuroscience, power systems, communication networks)
- Modeled each arm as a Markov chain on a finite state space
- Provided the first-known lower and upper bounds on the limiting growth rate of the expected time to find the anomalous arm as the error probability vanishes for two distinct settings: rested bandits and restless bandits
- Findings published in [ISIT 2019](#), [ISIT 2020](#), [ISIT 2021](#), and [IEEE Transactions on Information Theory](#)
